

# Basics of k-means clustering

CLUSTER ANALYSIS IN PYTHON

Shaumik Daityari

Business Analyst

# Why k-means clustering?

- A critical drawback of hierarchical clustering: runtime
- K means runs significantly faster on large datasets

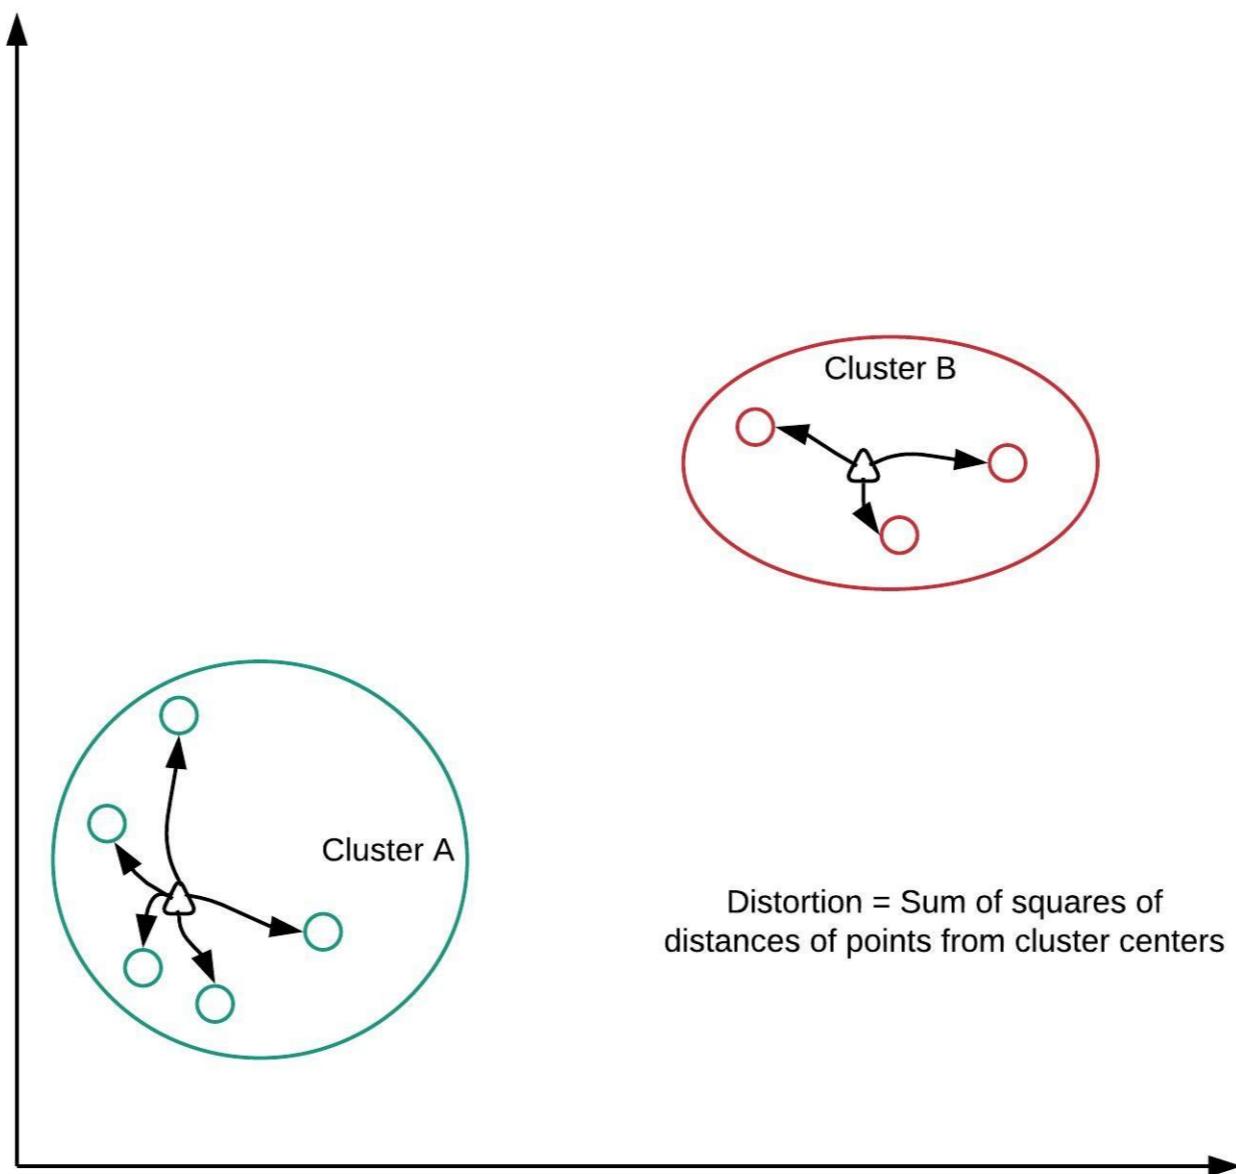

# Step 1: Generate cluster centers

```
kmeans(obs, k_or_guess, iter, thresh, check_finite)
```

- `obs` : standardized observations
- `k_or_guess` : number of clusters
- `iter` : number of iterations (default: 20)
- `thres` : threshold (default: 1e-05)
- `check_finite` : whether to check if observations contain only finite numbers (default: True)

Returns two objects: cluster centers, distortion

# How is distortion calculated?

## Step 2: Generate cluster labels

```
vq(obs, code_book, check_finite=True)
```

- `obs` : standardized observations
- `code_book` : cluster centers
- `check_finite` : whether to check if observations contain only finite numbers (default: True)

Returns two objects: a list of cluster labels, a list of distortions

# A note on distortions

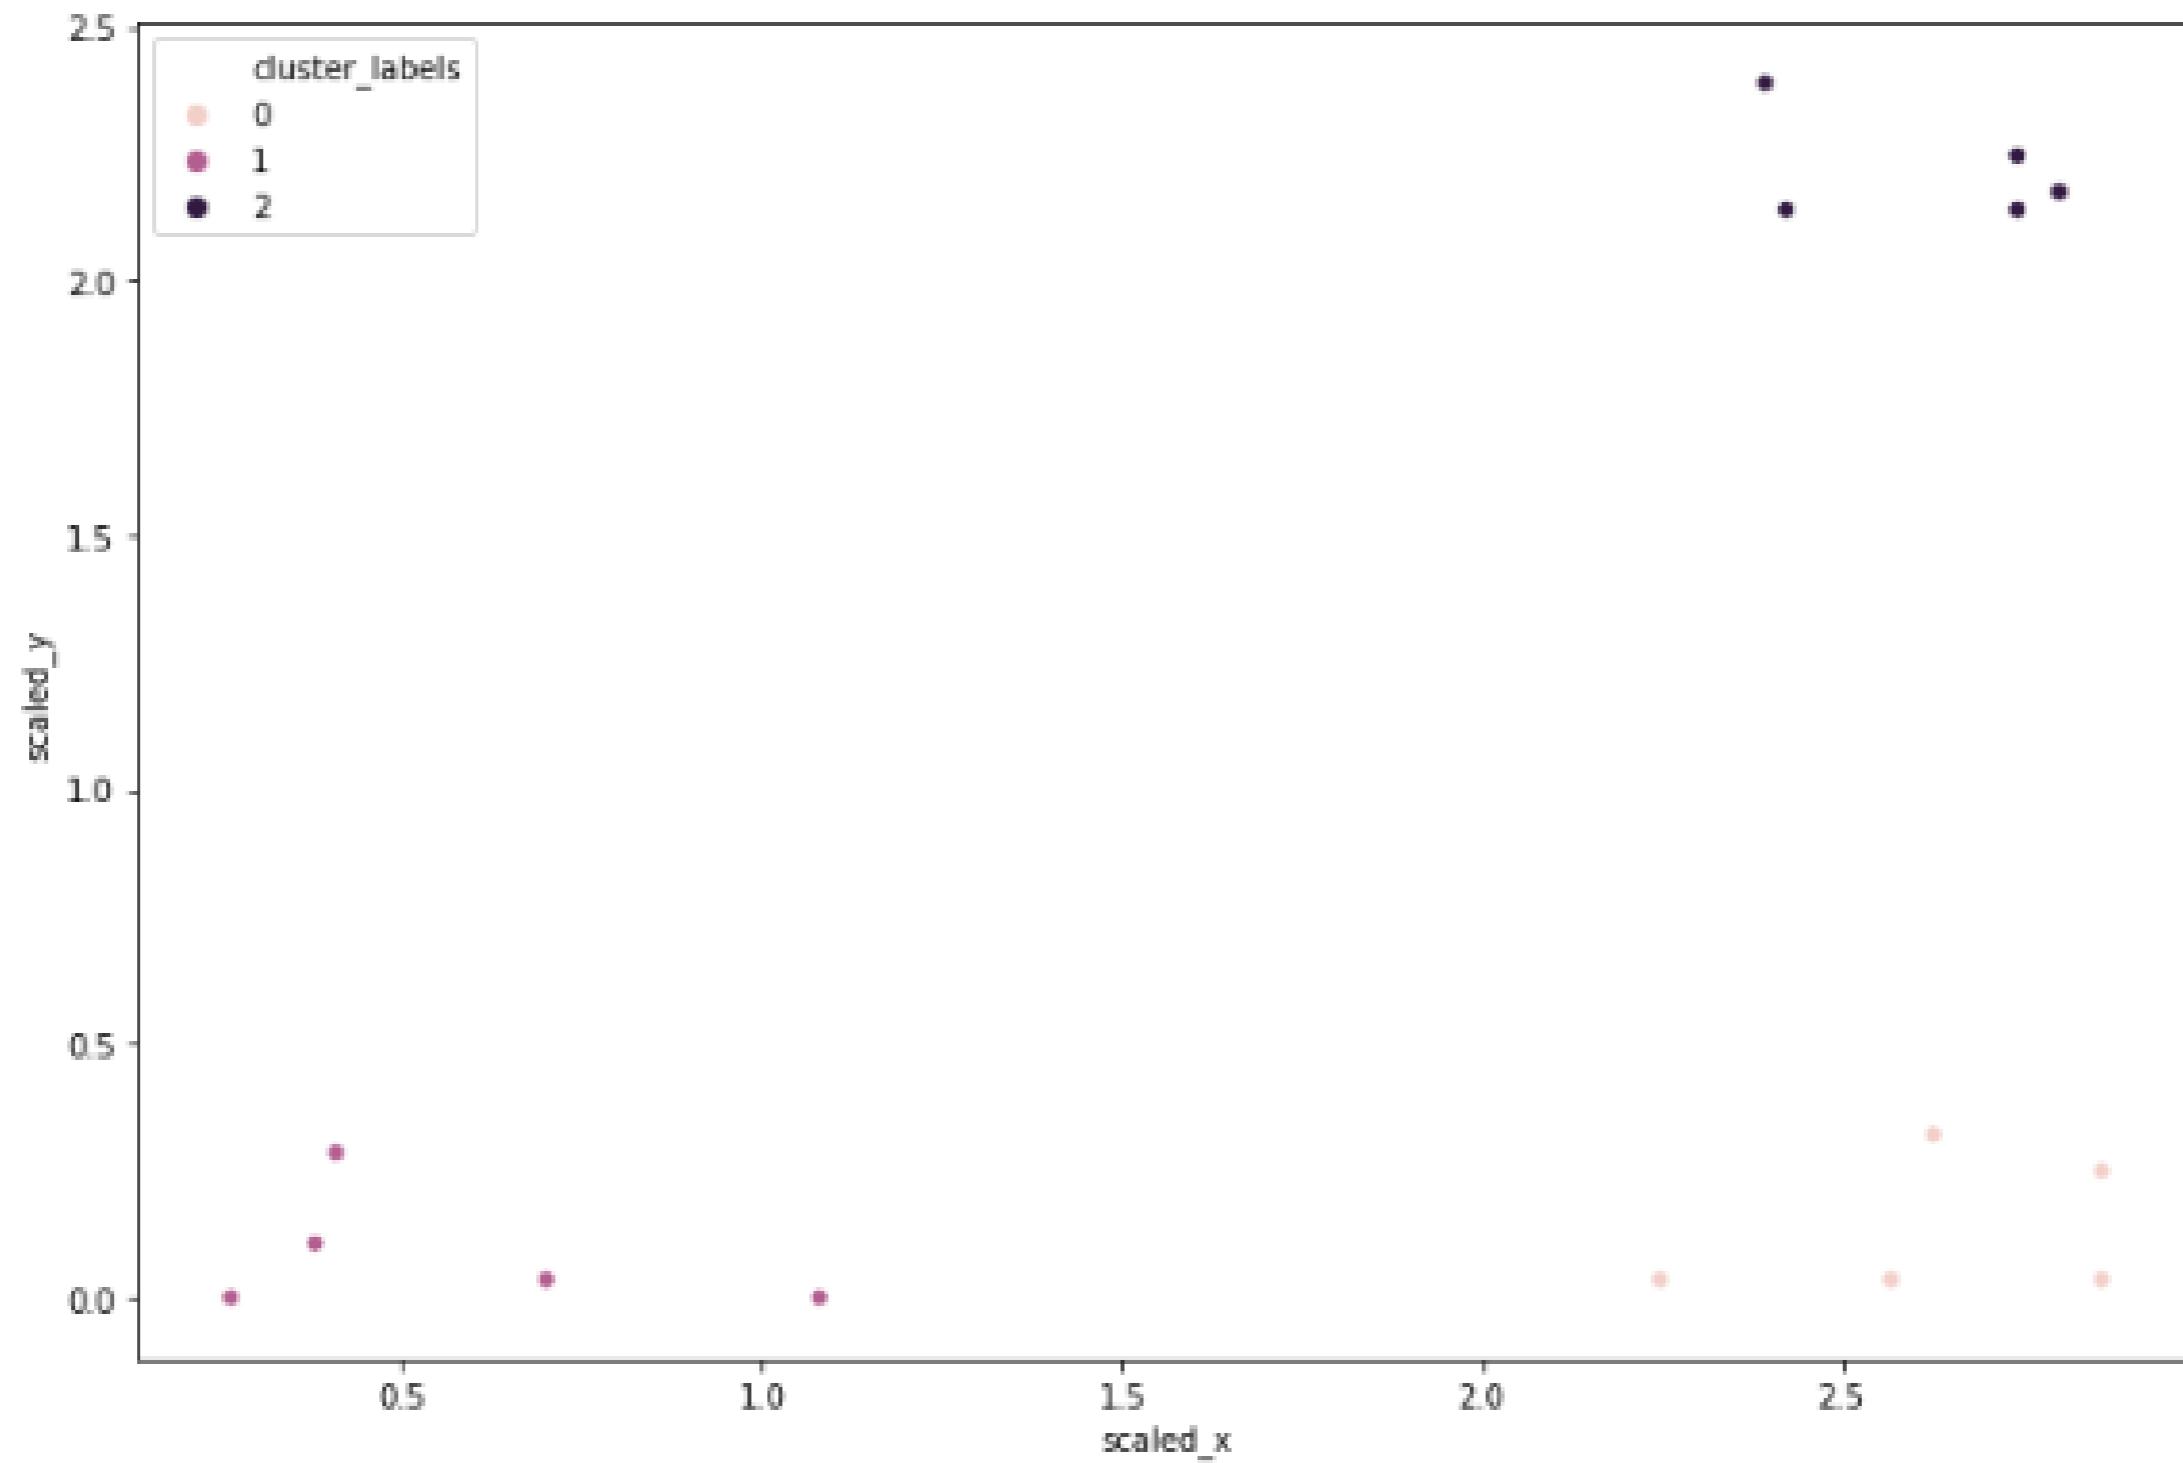

- `kmeans` returns a single value of distortions
- `vq` returns a list of distortions.

# Running k-means

```
# Import kmeans and vq functions
from scipy.cluster.vq import kmeans, vq

# Generate cluster centers and labels
cluster_centers, _ = kmeans(df[['scaled_x', 'scaled_y']], 3)
df['cluster_labels'], _ = vq(df[['scaled_x', 'scaled_y']], cluster_centers)

# Plot clusters
sns.scatterplot(x='scaled_x', y='scaled_y', hue='cluster_labels', data=df)
plt.show()
```

**CLUSTER ANALYSIS IN PYTHON**

# How many clusters?

CLUSTER ANALYSIS IN PYTHON

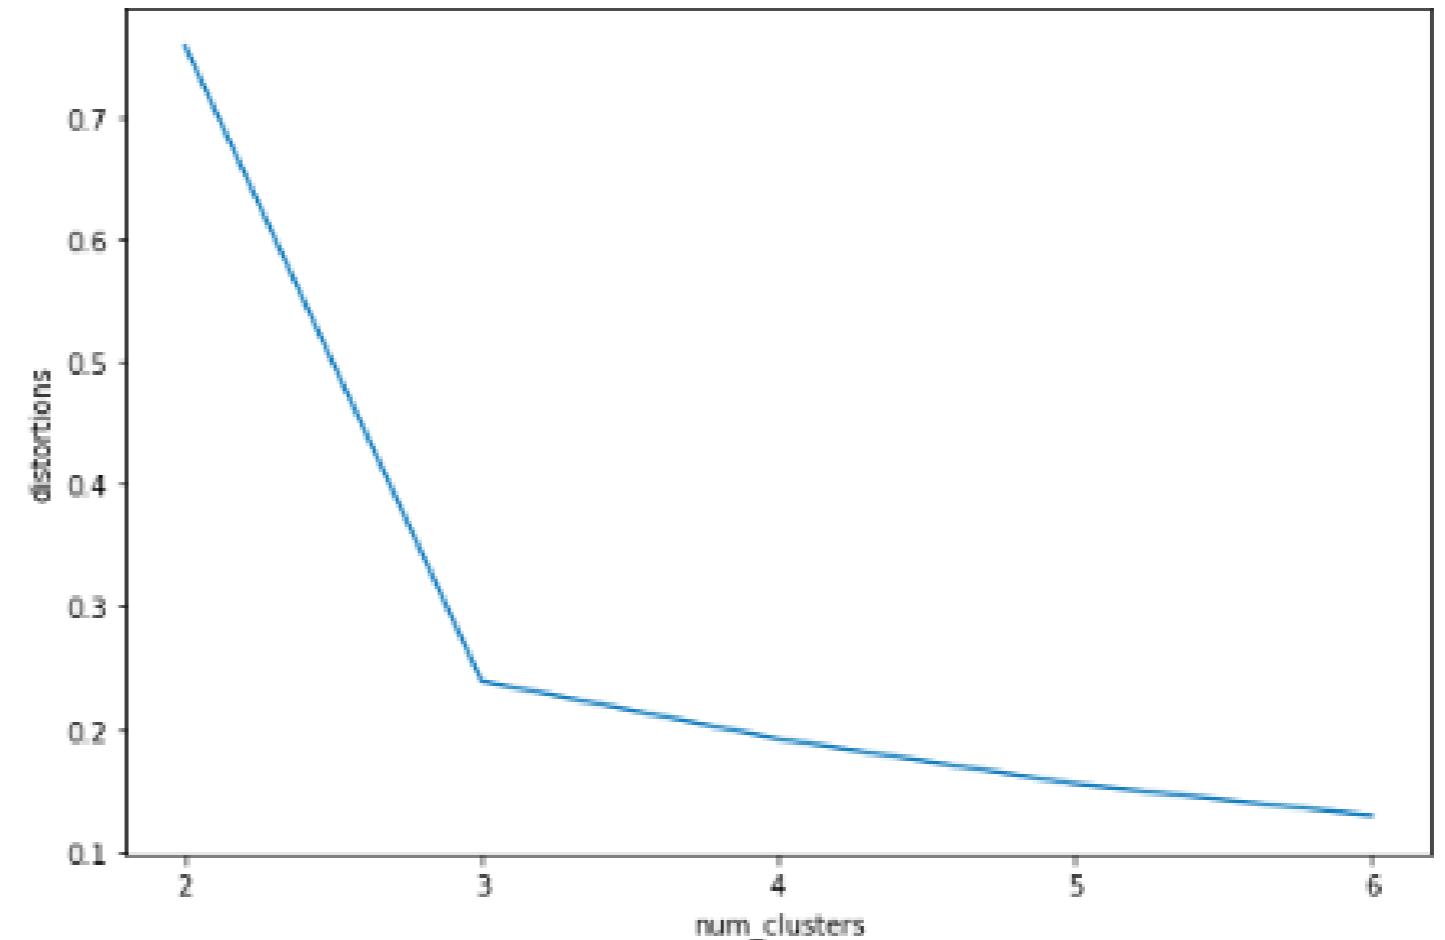

Shaumik Daityari

Business Analyst

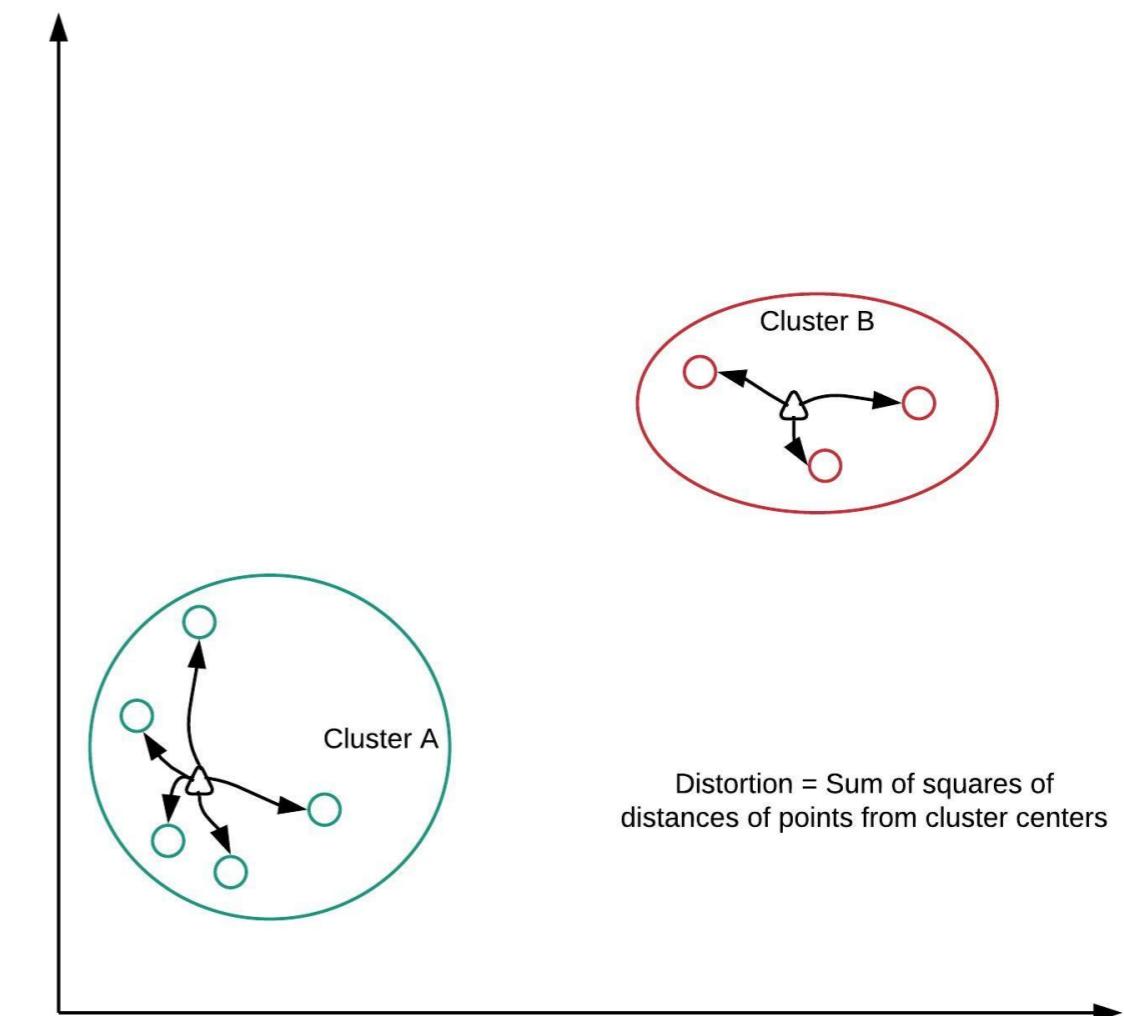

# How to find the right k?

- No *absolute* method to find right number of clusters (k) in k-means clustering
- Elbow method

# Distortions revisited

- Distortion: sum of squared distances of points from cluster centers
- Decreases with an increasing number of clusters
- Becomes zero when the number of clusters equals the number of points
- Elbow plot: line plot between cluster centers and distortion

# Elbow method

- Elbow plot: plot of the number of clusters and distortion
- Elbow plot helps indicate number of clusters present in data

# Elbow method in Python

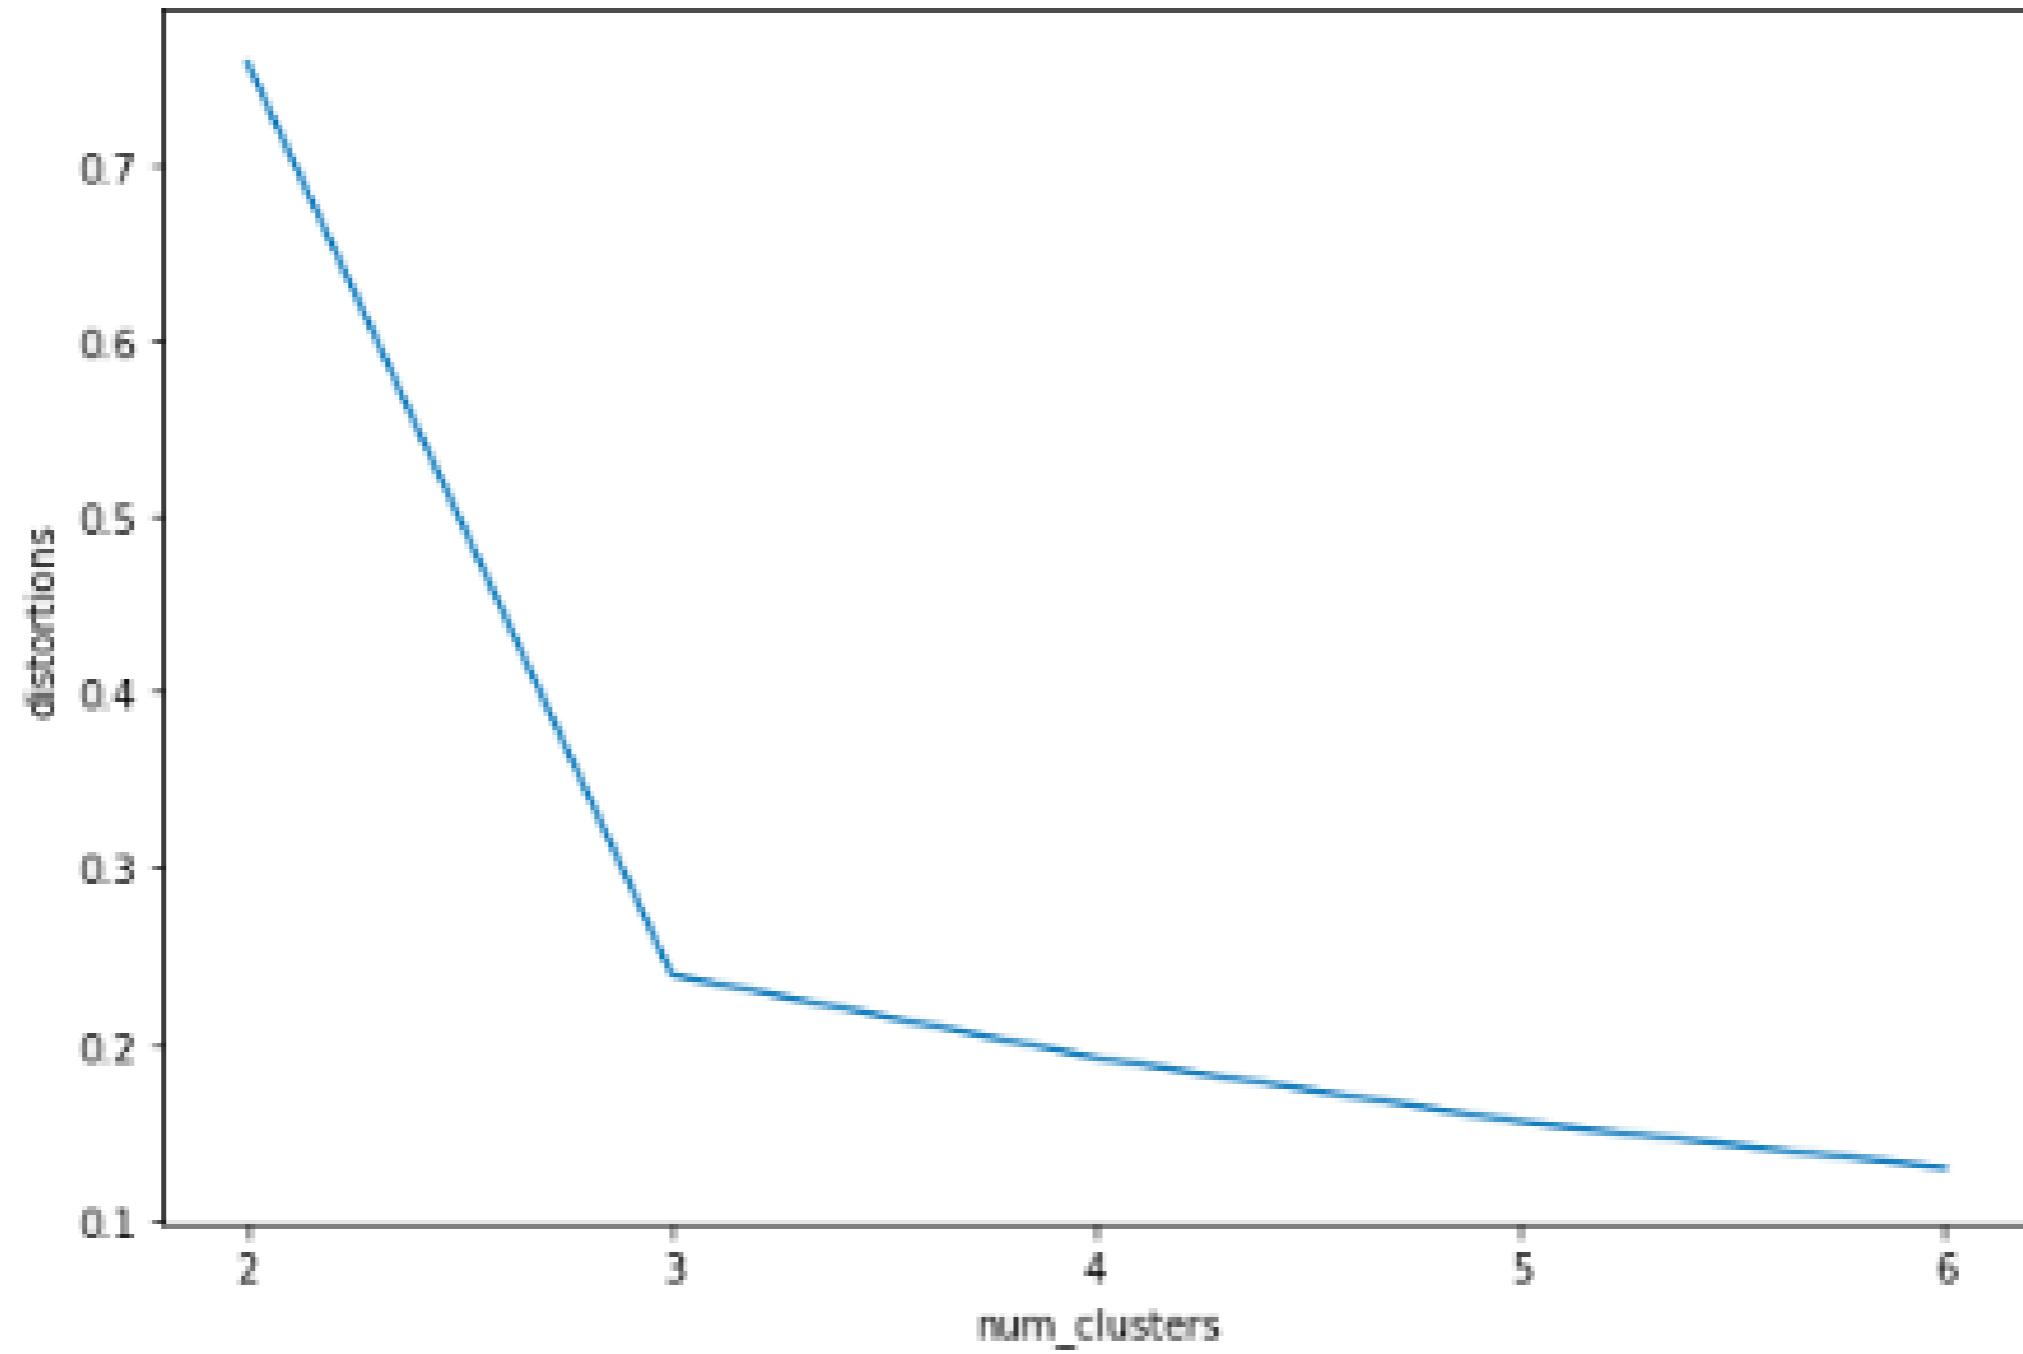

```
# Declaring variables for use
distortions = []

num_clusters = range(2, 7)

# Populating distortions for various clusters
for i in num_clusters:
    centroids, distortion = kmeans(df[['scaled_x', 'scaled_y']], i)
    distortions.append(distortion)

# Plotting elbow plot data
elbow_plot_data = pd.DataFrame({'num_clusters': num_clusters,
                                 'distortions': distortions})

sns.lineplot(x='num_clusters', y='distortions',
             data = elbow_plot_data)
plt.show()
```

# Final thoughts on using the elbow method

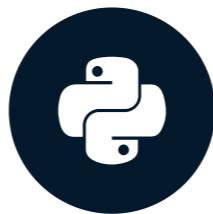

- Only gives an indication of optimal  $k$  (numbers of clusters)
- Does not always pinpoint how many  $k$  (numbers of clusters)
- Other methods: average silhouette and gap statistic

# **Next up: exercises**

**CLUSTER ANALYSIS IN PYTHON**

# Limitations of k-means clustering

CLUSTER ANALYSIS IN PYTHON

Shaumik Daityari

Business Analyst

# Limitations of k-means clustering

- How to find the right  $_K_$  (number of clusters)?
- Impact of seeds
- Biased towards equal sized clusters

# Impact of seeds

Initialize a random seed

```
from numpy import random  
random.seed(12)
```

Seed: np.array(1000, 2000)

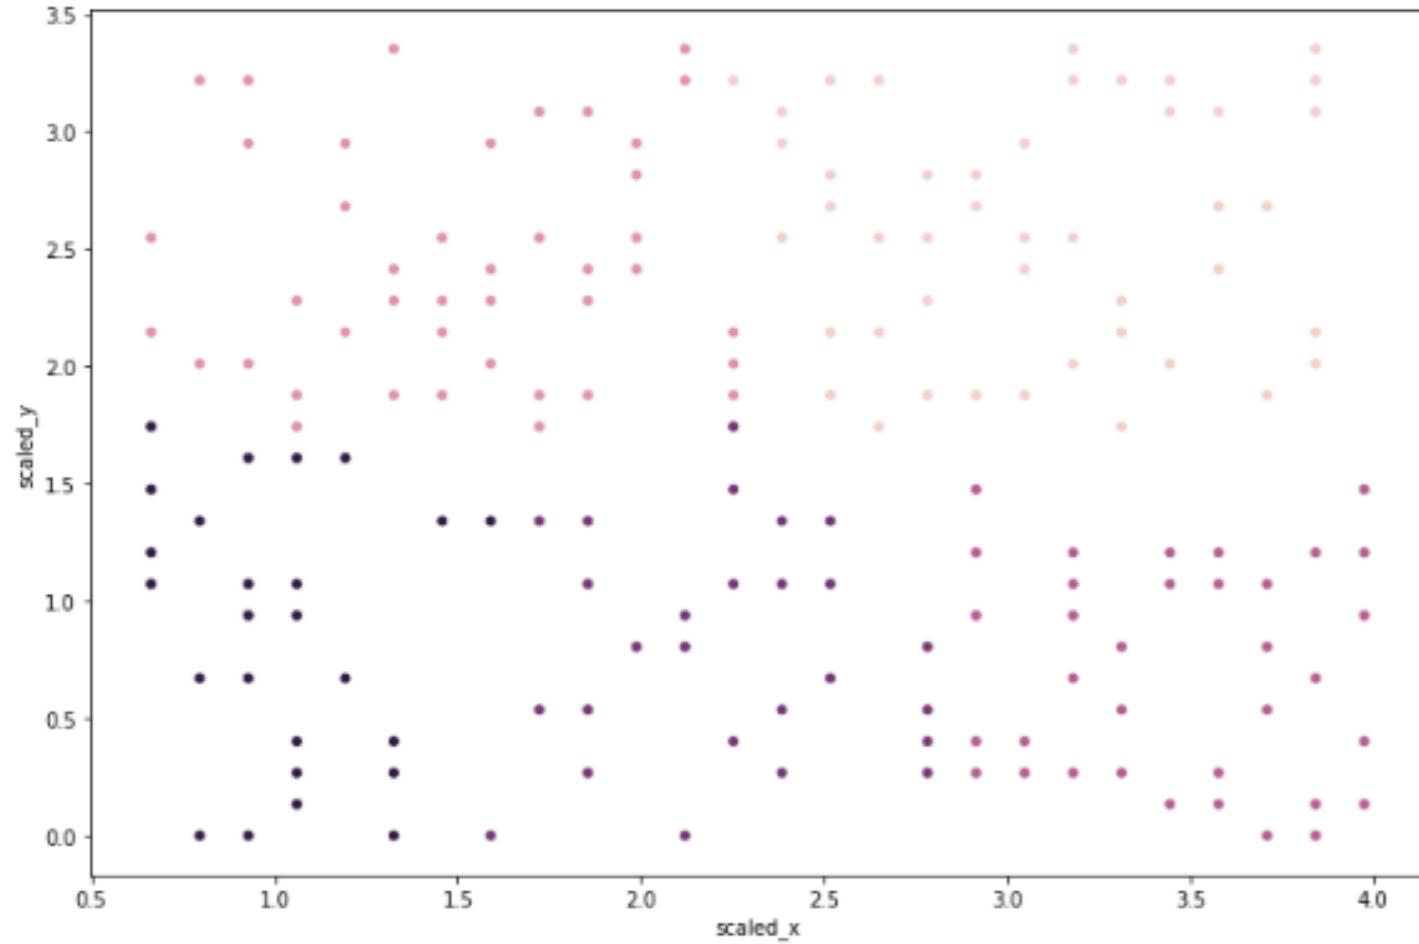

Cluster sizes: 29, 29, 43, 47, 52

Seed: np.array(1,2,3)

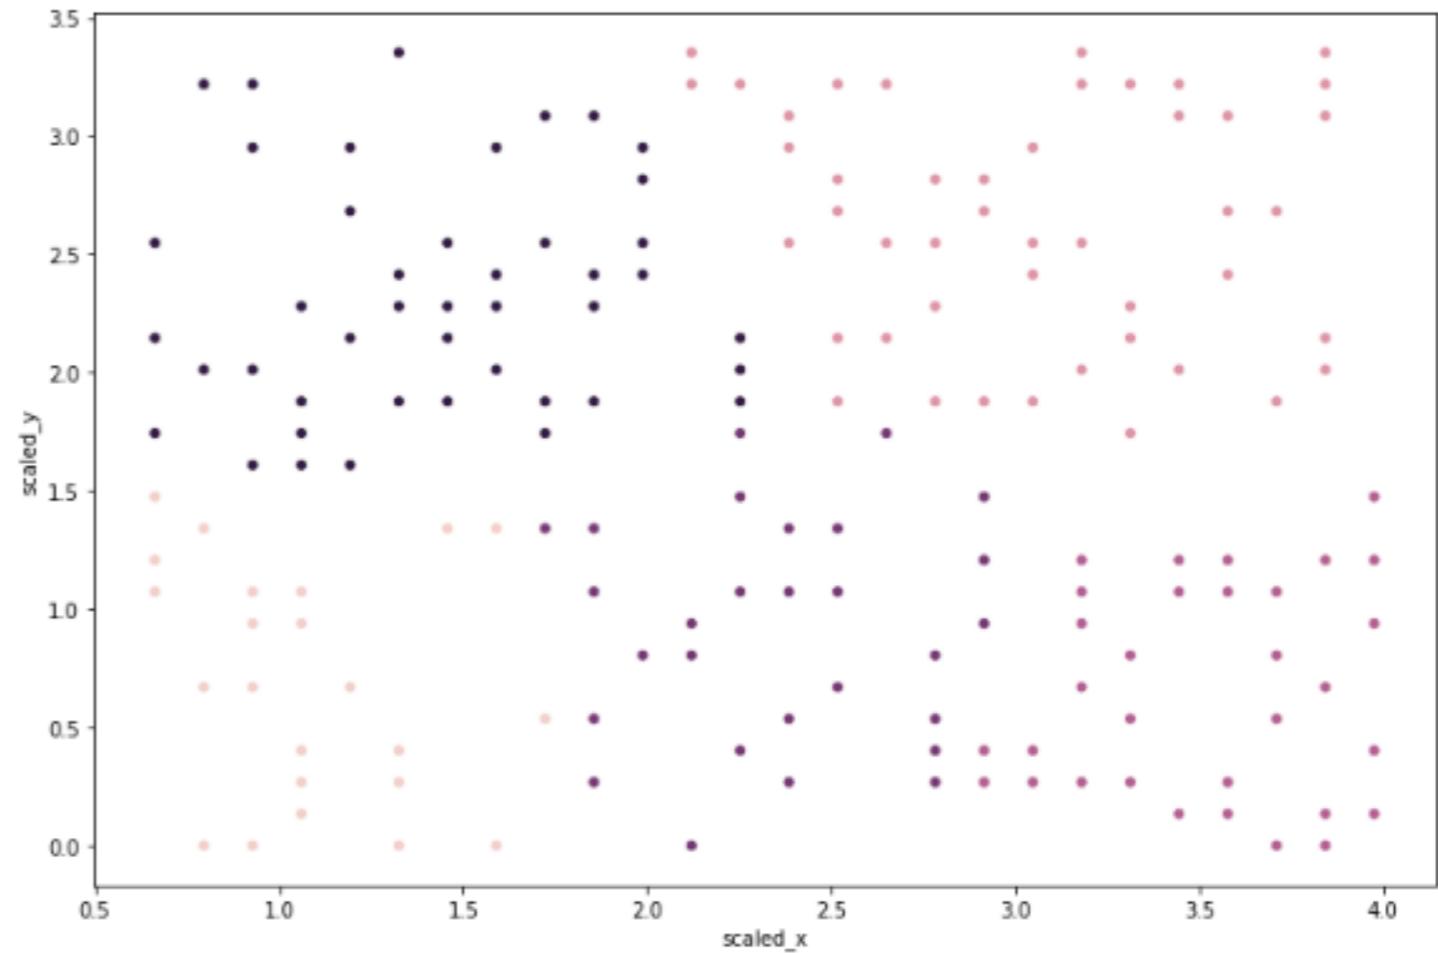

Cluster sizes: 26, 31, 40, 50, 53

# Impact of seeds: plots

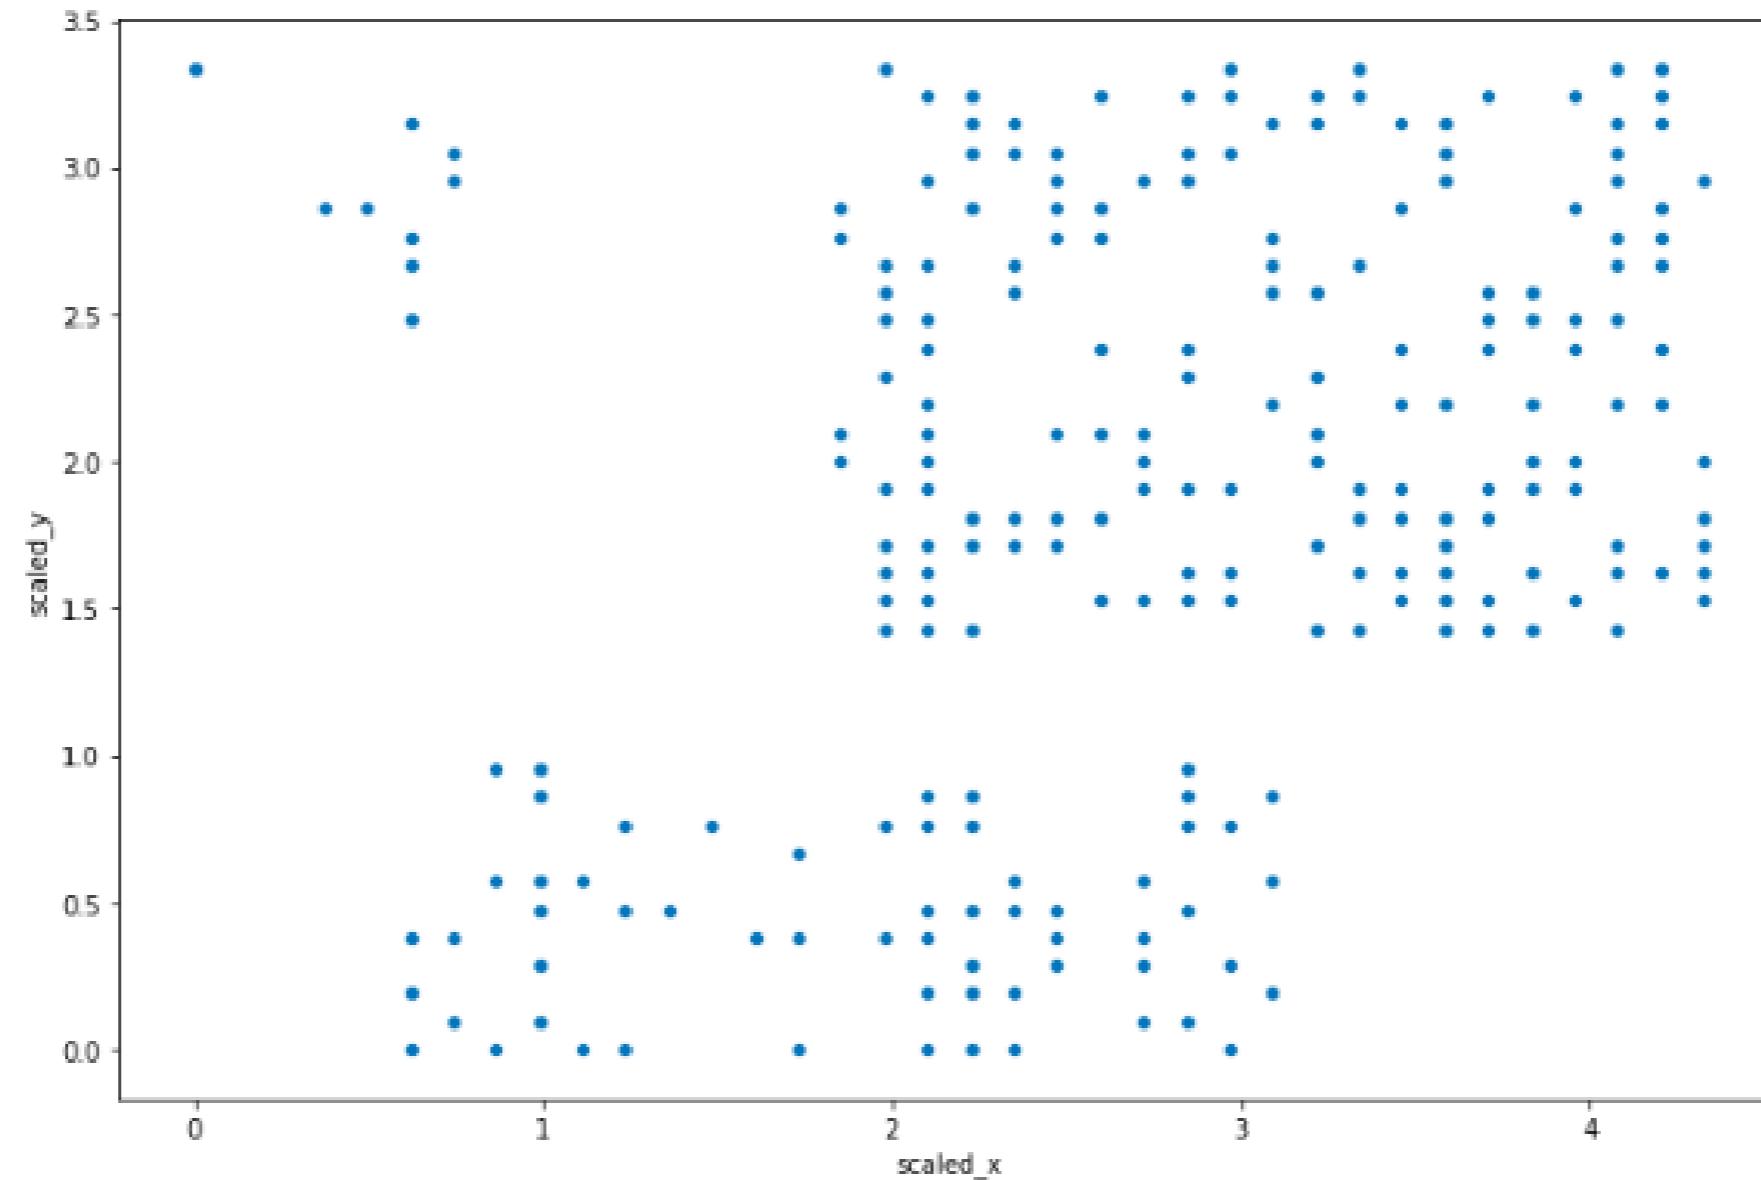

Seed: `np.array(1000, 2000)`

Seed: `np.array(1,2,3)`

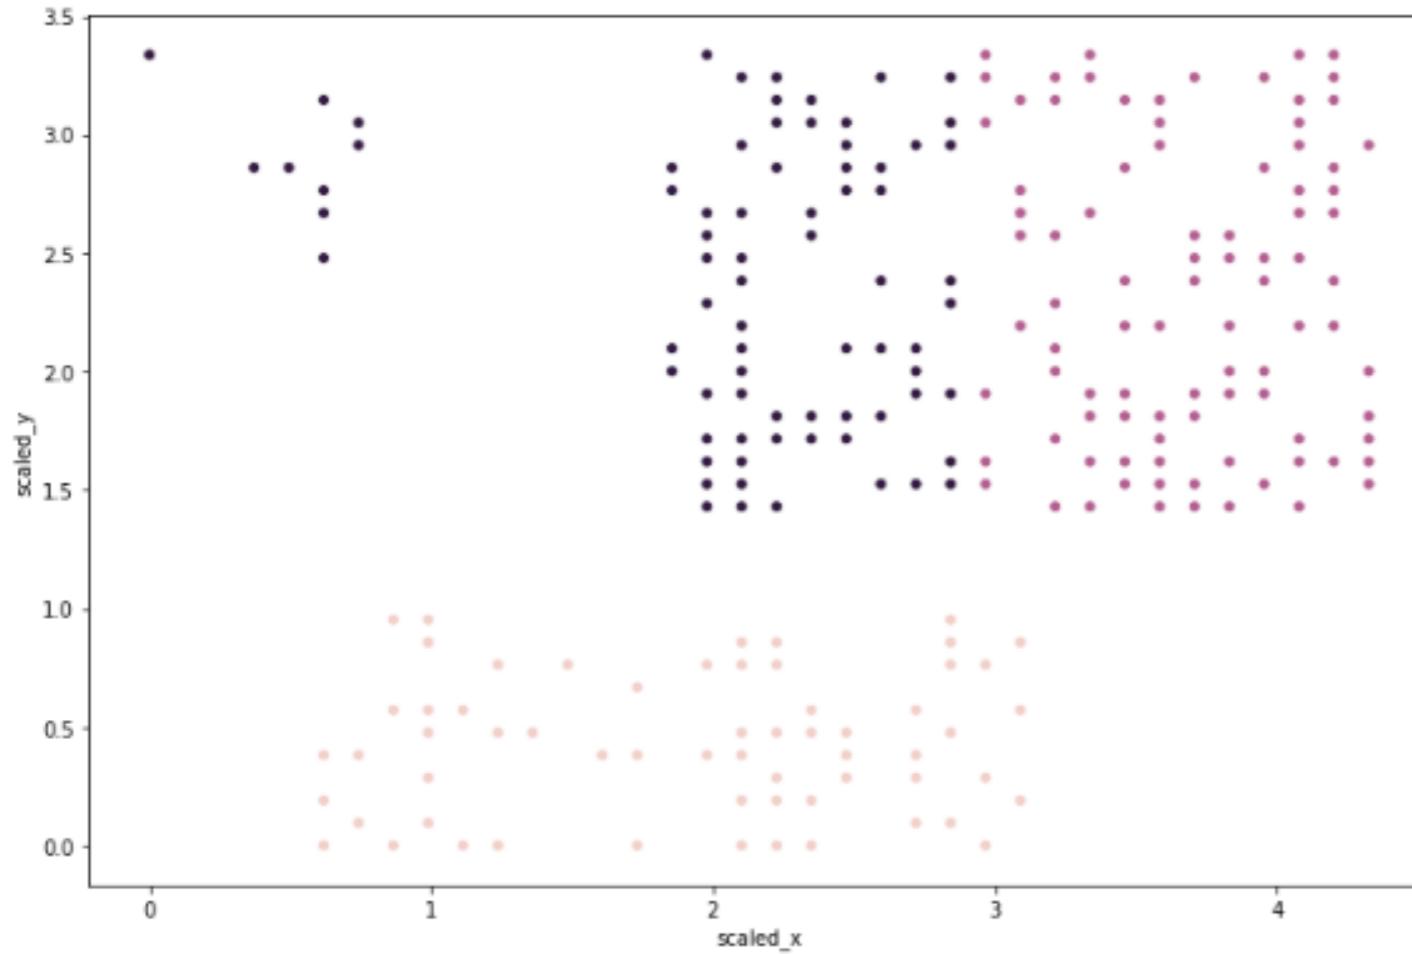

# Uniform clusters in k means

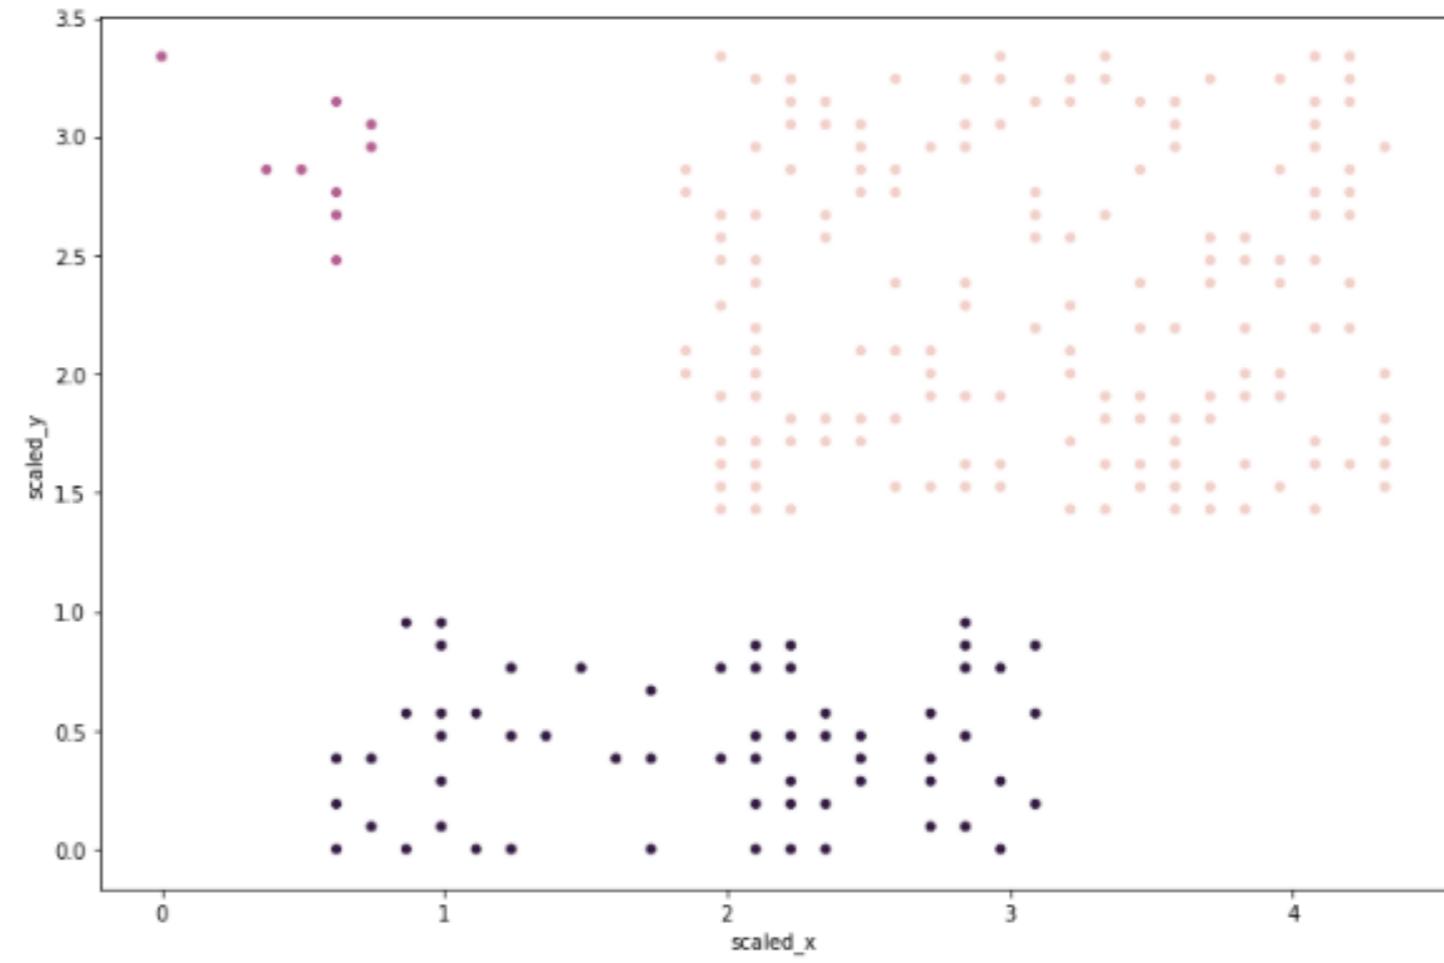

# Uniform clusters in k-means: a comparison

K-means clustering with 3 clusters

Hierarchical clustering with 3 clusters

# Final thoughts

- Each technique has its pros and cons
- Consider your data size and patterns before deciding on algorithm
- Clustering is exploratory phase of analysis
